

Reviews on the Feedback:

Suggestion	Improvements
1. No details about description of the data like all the variables or features and observational units is added in the proposal. Adding small sample of dataset would have helped me to understand better what are the other relevant features impacting CO2 emissions rather than just countries and year columns as shown in the graphs used.	1. Added the data description. Feature engineering is yet to be done, as there are total of 80 columns, by doing further analysis, we are going to select the necessary features that are required for our project.
2. Considering the implementation of Time-series analysis technique as the is the time factor in the data (year 1750-2022)	2. For now, we are considering to do Linear Regression and Multi-Variate Regression. We are keeping this as a future scope of our project.
3. Adding details about success criteria and a short detail on what model performance analysis metrics will be used to evaluate the model will help me understand the work flow better.	3. Added the success criteria for the statistical analysis.
4. References could also include dataset links and the eda references to be used in the project.	4. Added the dataset link in the reference.
